

Renewable Energy Villages and Regions: How Universities may Support Sustainable Communities

Prof. Peter Schmuck

**Interdisciplinary Centre of Sustainable Development
University of Göttingen (Germany)**

The way from the vision to projects

Sustainability science: the Göttingen approach

Examples for sustainable communities

- The bioenergy community
 - The solar heat community
 - The satellite heat community
 - The agroforest community
 - The permaculture community
 - Sustainable cities
-
- Conclusion: Universities as incubators for regional sustainability transformation

The process: Vision -> Project -> Transfer

Formulating the own vision

forming an initiative group at university

formulating the project

ensuring political and financial support

find partners in communities

perform best-practice studies

realization

transfer

The Göttingen approach of sustainability science

Role A

(1) RESEARCH

Role B

(2-7) CONTRIBUTION TO SOLVE GLOBAL PROBLEMS

(2) Select a critical
global problem

(7) Transfer of the solution
to the regional, national
and global level

(3) Create an
alternative
solution

(4) Search for
political and
financial support

(5) Search for
partners in
practice

(6) Run a local
demonstration
model

Examples for sustainable communities

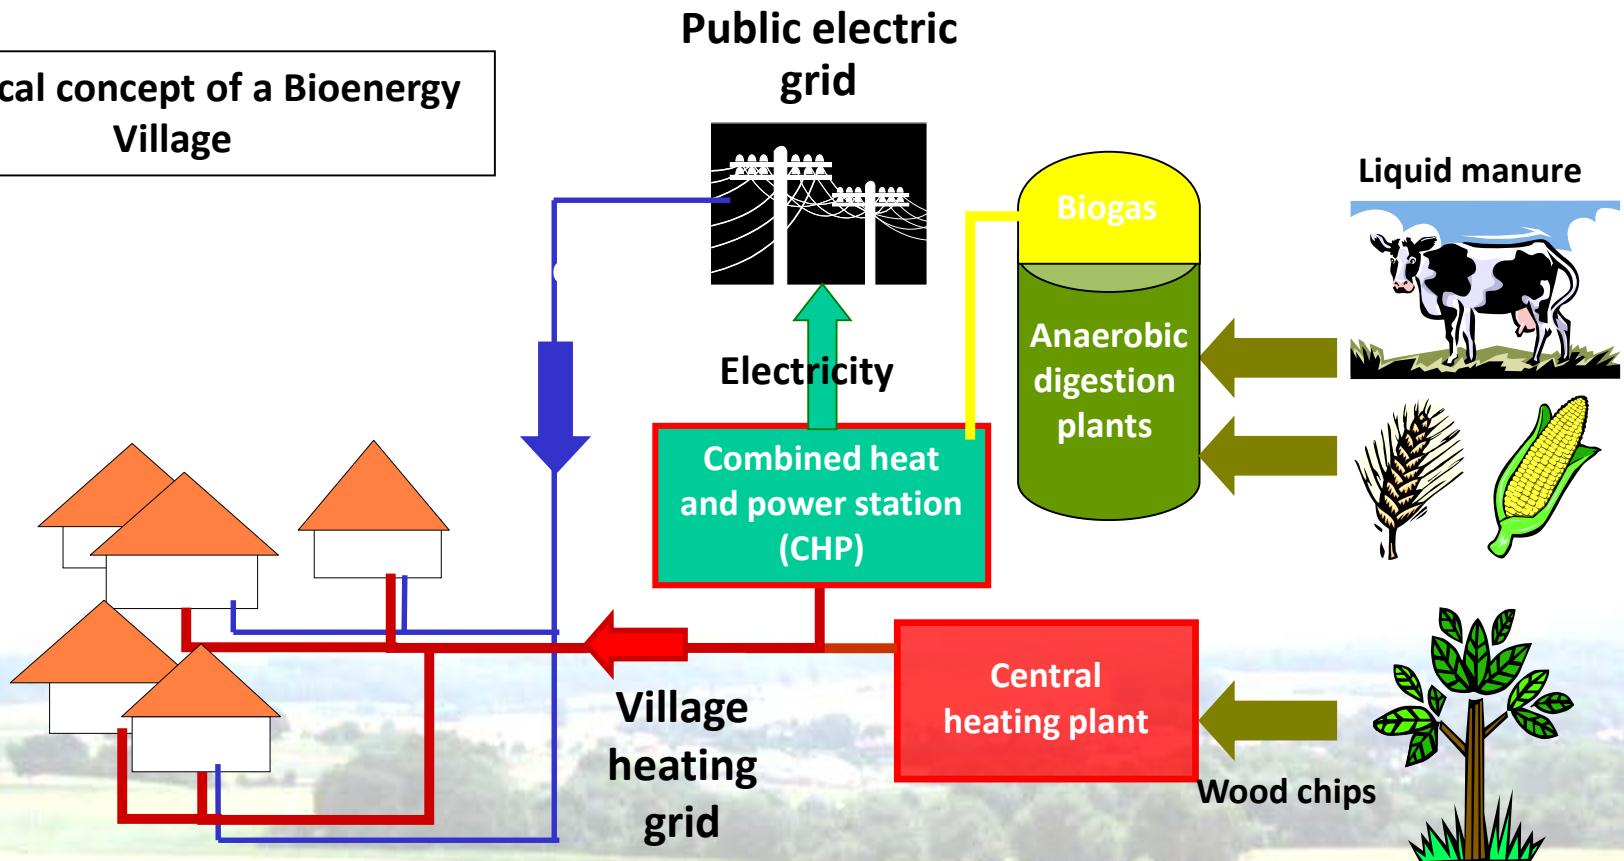

- The bioenergy community
- The solar heat community
- The satellite heat community
- The agroforest community
- The permaculture community
- Sustainable cities

Bioenergy villages as examples for integrated projects

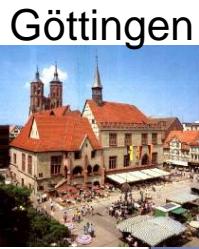

Definition:

A village/region that covers its own heat and electricity demand with locally available biomass (combined with other renewable energy sources)

Technical concept of a Bioenergy Village

Bioenergy Village (BEV) Jühnde

800 inhabitants

9 farmers

1300 ha farmland

800 ha forest

Complex problems need complex solutions!

We need an interdisciplinary approach!

Universities Goettingen and Kassel in Germany

Involved Disciplines:

Agronomy & Crop Science

Soil Sciences

Geosciences

Economy

Sociology

Psychology

Political Sciences

Planning process / operating company

Social implementation in the village through motivation and participation of individuals and groups

The project's psychological part: Main goals & results

* **Foster motivation for the transformation**

Method

- **interviews in comparable best practice projects**
- **applying the success factors in the own project**

Result: the majority of the village people cooperated

* **Test of long term changes in psychological variables:
sense of community, self efficacy, well-being**

Method:

- **longitudinal study with control group based on a questionnaire**
- **interviews with the most engaged people of the village**

Result: the people profited psychologically from the change

Climate relevant results:

CO2 emissions per capita and year

Average in Germany: **10 tons**

In Jühnde after the conversion to renewable energy: **4 tons**

Other results:

Schmuck, P. Eigner-Thiel, S., Karpenstein-Machan, M., Sauer, B., Roland, F. & Ruppert, H. (2013). *Bioenergy villages in Germany: The history of promoting sustainable bioenergy projects within the “Göttingen Approach of Sustainability Science”*. In M. Kappas & H. Ruppert (Eds.), *Sustainable bioenergy production: An integrated approach*. Heidelberg: Springer.

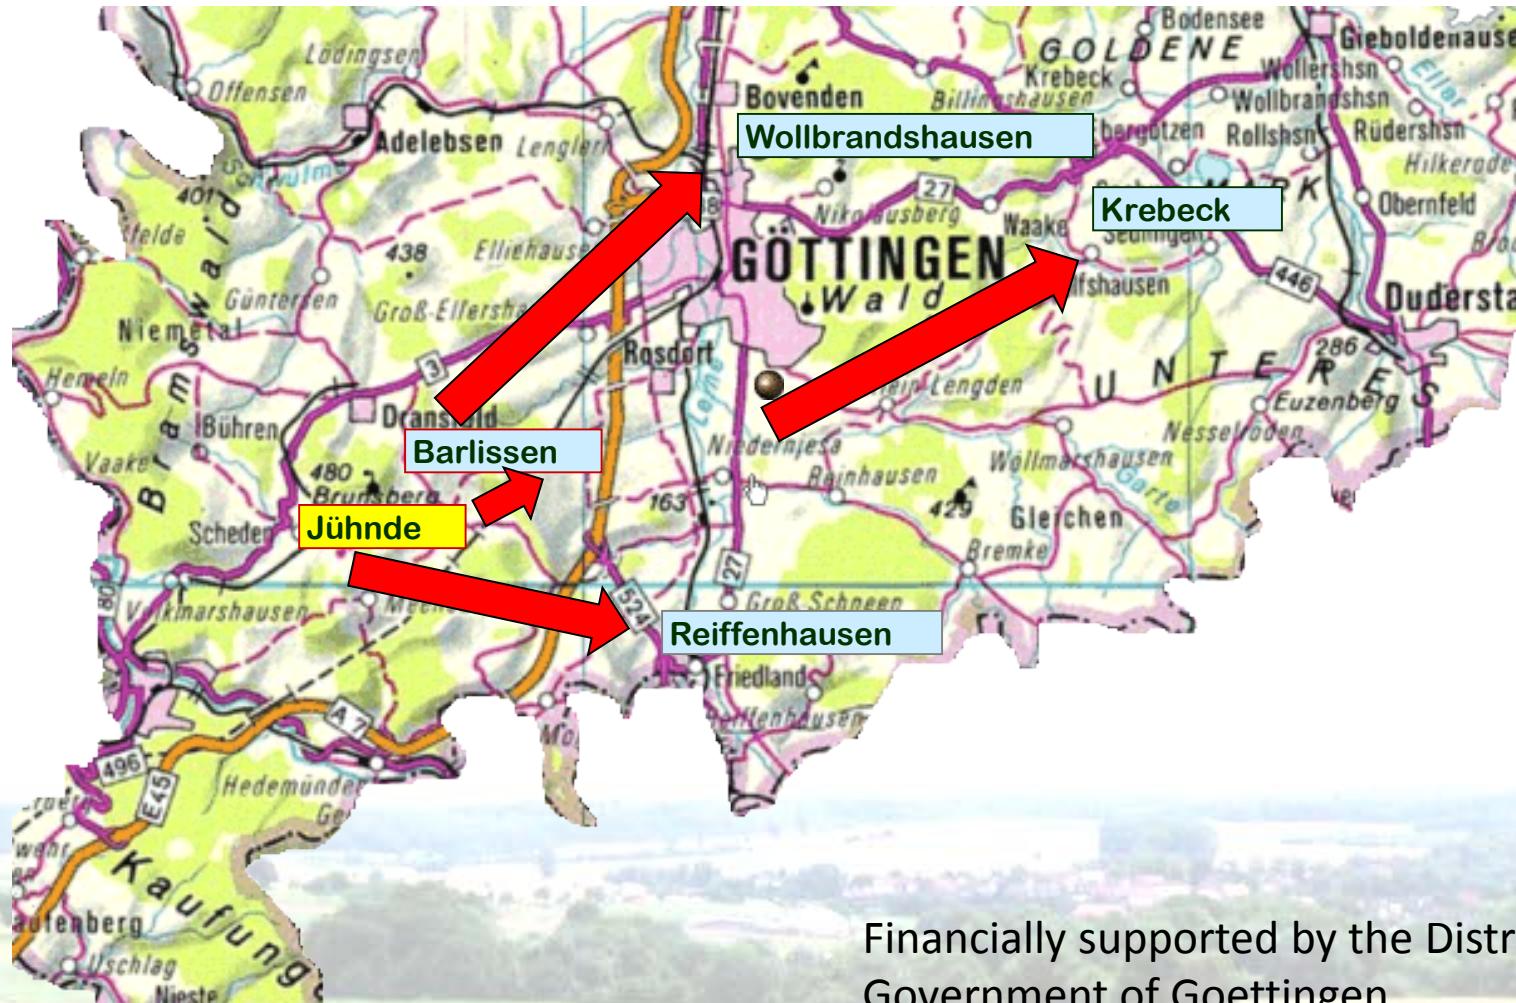

Transfer:

**Thousands of
visitors come
every year
to Jühnde**

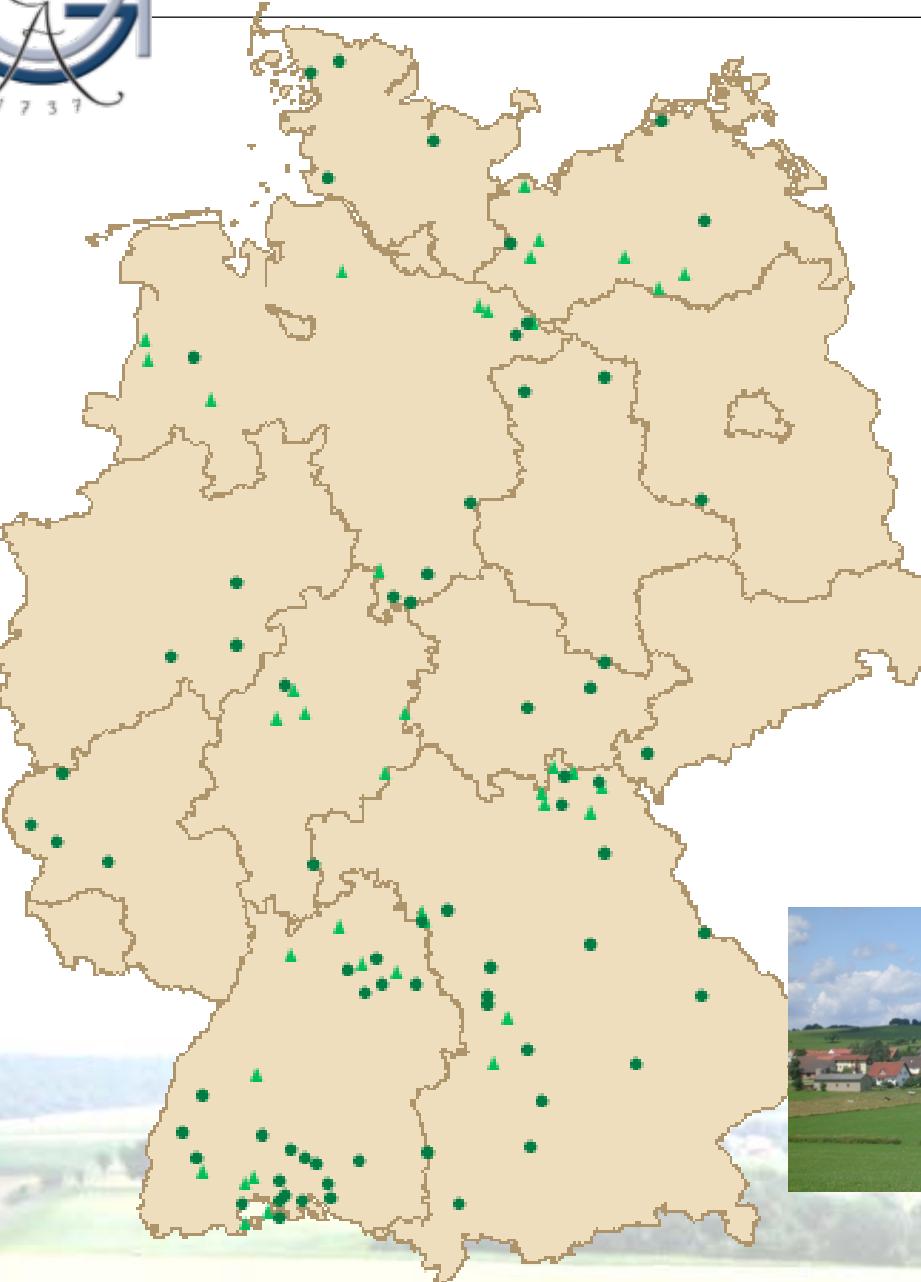

**“Cook book”
Publication:
Wege zum
Bioenergiedorf**

Transfer results: Four further bioenergy villages (BEV) were established between 2006 and 2009

Financially supported by the District Government of Goettingen

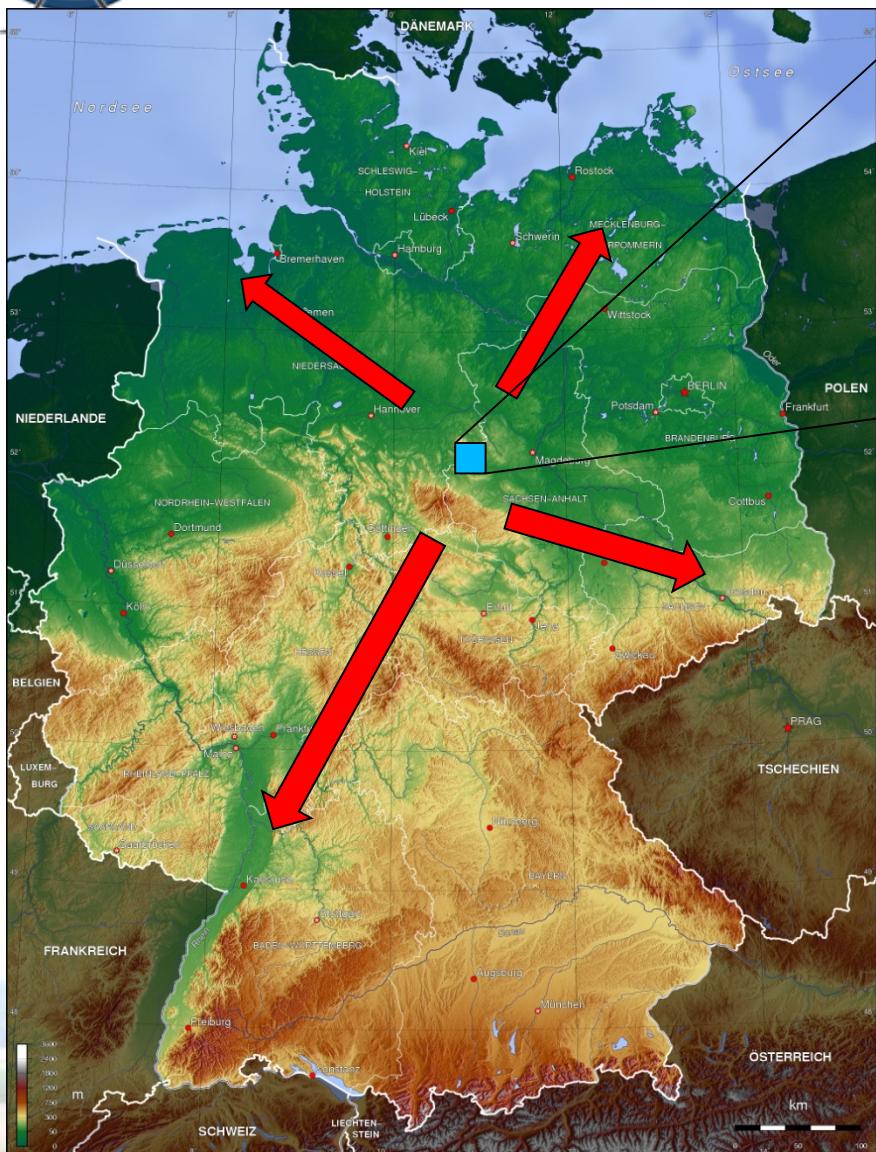

Transfer results: Bioenergy villages in Germany 2016

- approximately 150 bioenergy villages in Germany
- See www.wege-zum-bioenergiedorf.de

Examples for sustainable communities

- The bioenergy community
- The solar heat community
- The satellite heat community
- The agroforest community
- The permaculture community
- Sustainable cities

**Heat energy is completely won by solartherm installation with a seasonal heat storage system.
Feasibility study is finished.**

Examples for sustainable communities

- The bioenergy community
- The solar heat community
- **The satellite heat community**
- The agroforest community
- The permaculture community
- Sustainable cities

Village with fossile heatings

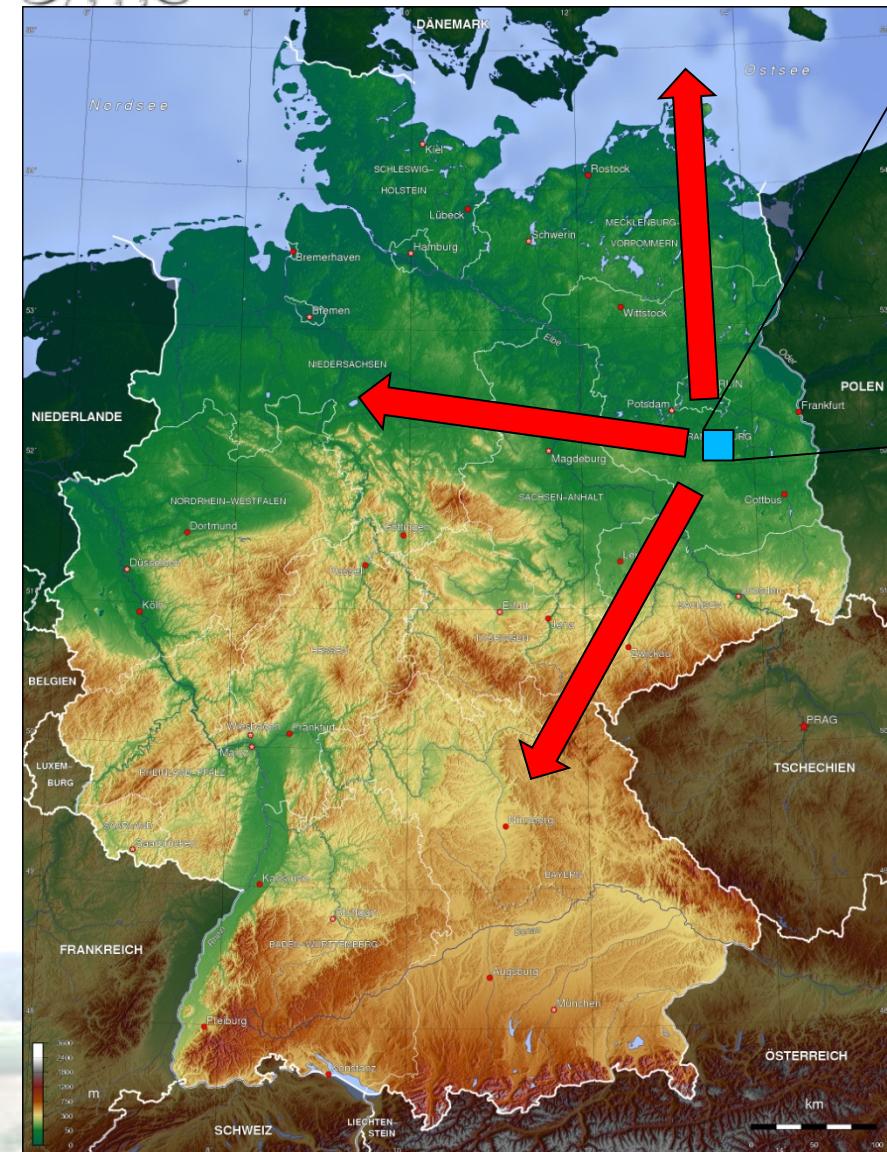

Hot water tube connection !!!

Combined heat and power engine
not using the heat

Intended project:
**A satellite-heat community uses the heat of
one of the appr. 4000 biogas plants
in Germany which actually do not use
the heat of the CHP**

Examples for sustainable communities

- The bioenergy community
- The solar heat community
- The satellite heat community
- The agroforest community
- The permaculture community
- Sustainable cities

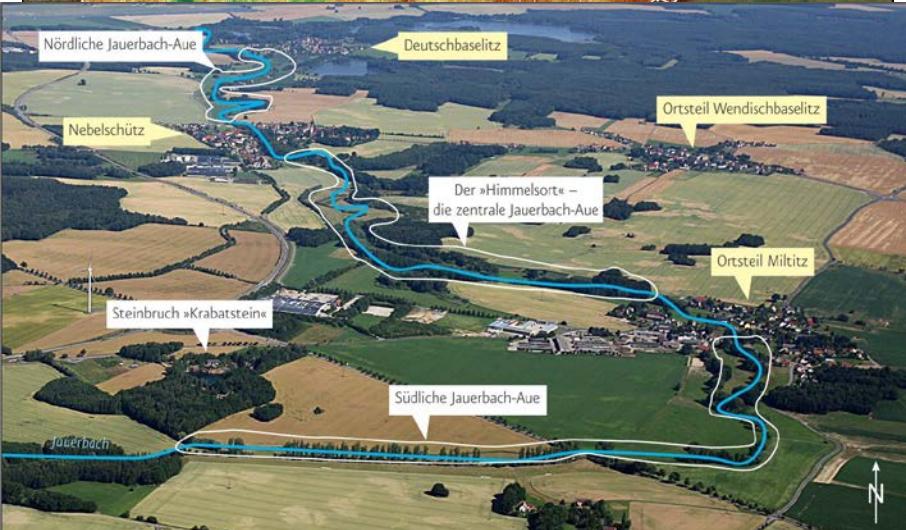

Intended project:
The agroforest community combines agriculture and forestry to get a local supply of food and energy – and to prevent erosion on big (monoculture) agricultural areas.

Examples for sustainable communities

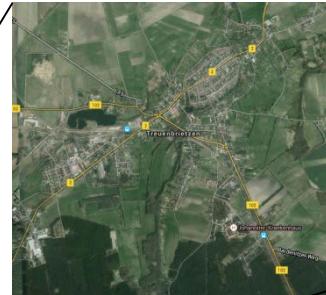

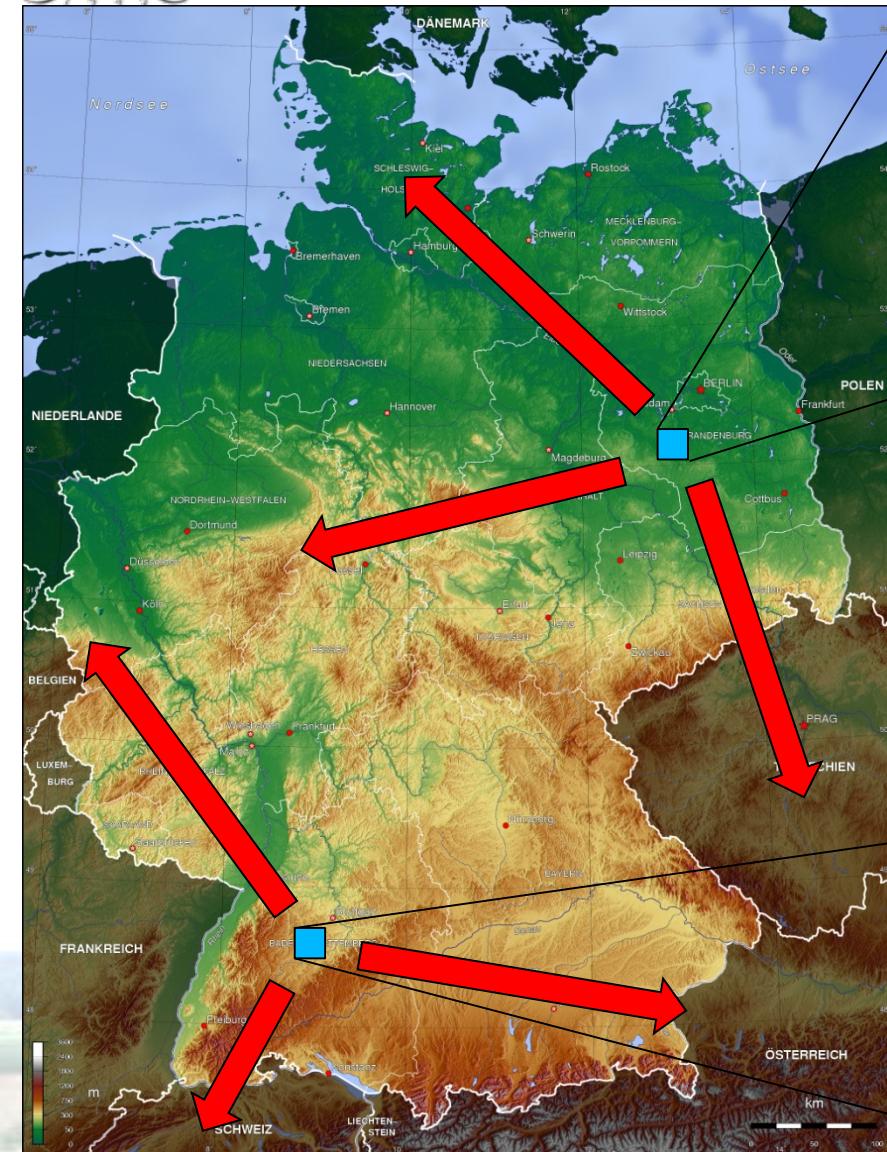

- The bioenergy community
- The solar heat community
- The satellite heat community
- The agroforest community
- The permaculture community
- Sustainable cities

Intended project:
Permaculture is the conscious design and maintenance of agriculturally productive systems which have the diversity, stability, and resilience of natural ecosystems. It is the harmonious integration of the landscape with people providing their food, energy, shelter and other material and non-material needs in a sustainable way.

Examples for sustainable communities

- The bioenergy community
- The solar heat community
- The satellite heat community
- The agroforest community
- The permaculture community
- Sustainable cities

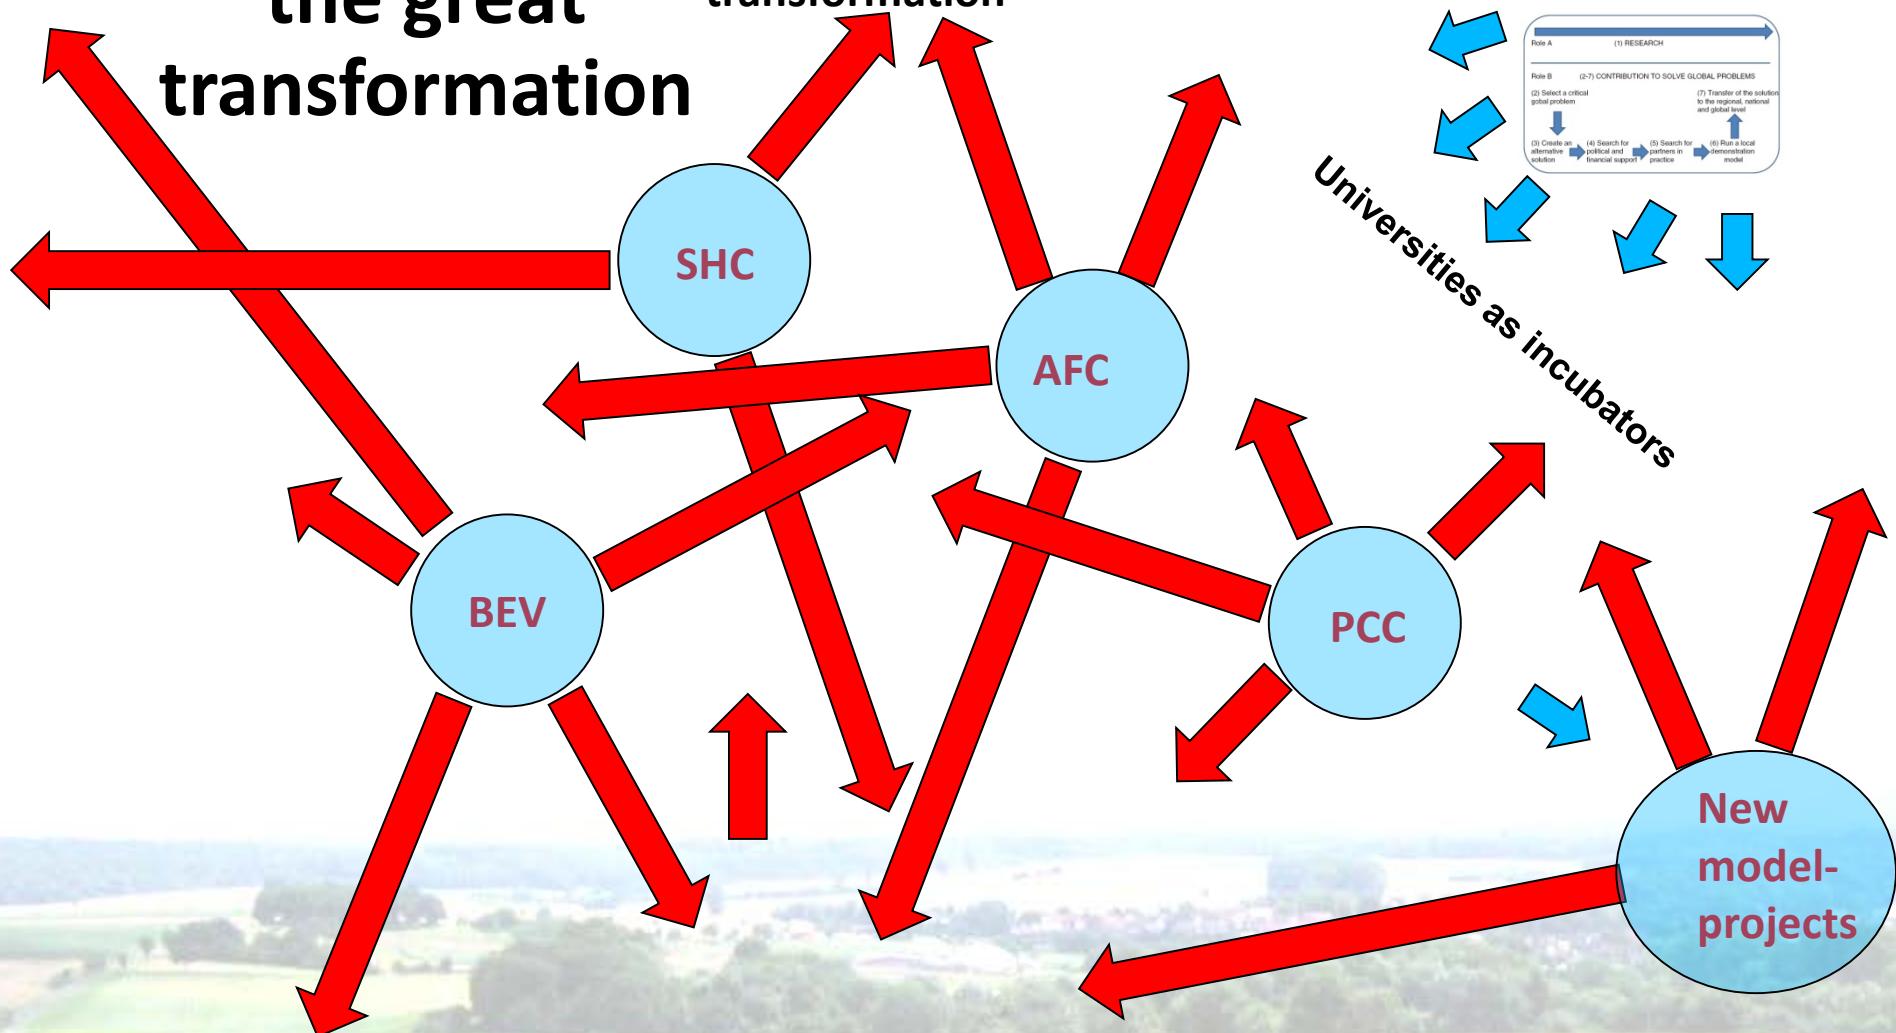

In the cities Treuenbrietzen and Münsingen are planned sustainability transformations regarding energy, food and transport aspects. The transfer of success factors to other interested cities will be enabled by an interactive internet platform.
Planned start: June 2016

Our vision of the great transformation

Development of prototypes/models of sustainable life patterns and their diffusion as one motor of great transformation

Thank you for the attention
